

Problem Statement:

People who work on problems or assignments, specifically college students, would benefit from a better collaboration and support resource in which students can collaborate in channels dedicated to their specific classes or projects all within one application.

What is the problem?

It's no secret that college assignments are difficult. Often, classes meet only a few times a week, so access to professors or TAs is very limited. Email responses can take days, which in the meantime students cannot work on their assignment. This leads to students being more inclined to cheat, submit incomplete work, or be forced down to the wire to finish on time.

Who is experiencing this problem?

This problem predominantly affects college students, but also extends to projects in the workplace. Upperclassmen in higher level courses experience this problem as their work becomes more complicated and underclassmen who haven't made many connections to others in their classes can also benefit from the ease of reaching out through the application.

Why does this problem need to be fixed?

College students are tasked with completing a high volume of difficult work. In order for them to complete this work in a timely manner and with the most accuracy while achieving an understanding of the concepts used, students often benefit from peer collaboration and support.
